

Introduction to computing

Use:

Stackoverflow

(Getting started with code) also
Learn

Anaconda → python + extra continuum.io
download feature

v 2.7 version

print "ab" → print("ab")

jupyter notebook

Expressions:-

$\boxed{-2} + \boxed{15}$ → operands
↓
Binary operator

/ → forward slash

\ → back slash

$(2+2) * 2$
↓
overriding
precedence

- you also know how to make your problem understandable to anyone.

- use correct terminology
- Explain your problem to someone in proper words.

Expression is everything which we can evaluate.

(Explore documentations)

very useful in programming

operator + operand → expression

Conditional operator:-

$3 < 4$, $3 == 4$

True, False → boolean type

Python is case sensitive.

$3 (< =) 4$

↓ it is atomic we cannot break it.

But not in C like that $\langle 'Abc' \rangle$ python has no issue

$\boxed{\backslash n}$ → escape character

""" This is -

--- """ → for multiline

"ab" + "cd"

str + str

output: 'abcd'

concatination

↳ > < > <

↓
~~Semantic error~~

T or F and F or F

T or F or F

T or F
T

"a" * 5 string * num

output: 'aaaaa'

And operator:

OR operator: True or False: True

True or False and False or False

True or False or False

Nesting:-

True or False

True ✓

max(min(1, -2), min(pow(3, 5), -4))

Call Expression:-

ایک بلاک کی کال

→ Function

: max(7, 9) → 9

: max(2+5, 9) → max(7, 9) → 9

: pow(100, 2) → 10000
