

lec 17:-

File handling :- persistanc storage

windows filesystem:-

↓
پے ڈالی
سٹقل

called
tree.

branches are
folder and
roots are drive -

↑ differ the folder
C:\user\inauman\docs\res\dum.txt ↘

mean all the path

← absolute path

From current directory: res\dummy.txt ↘

relative path
↑

e-g save word file

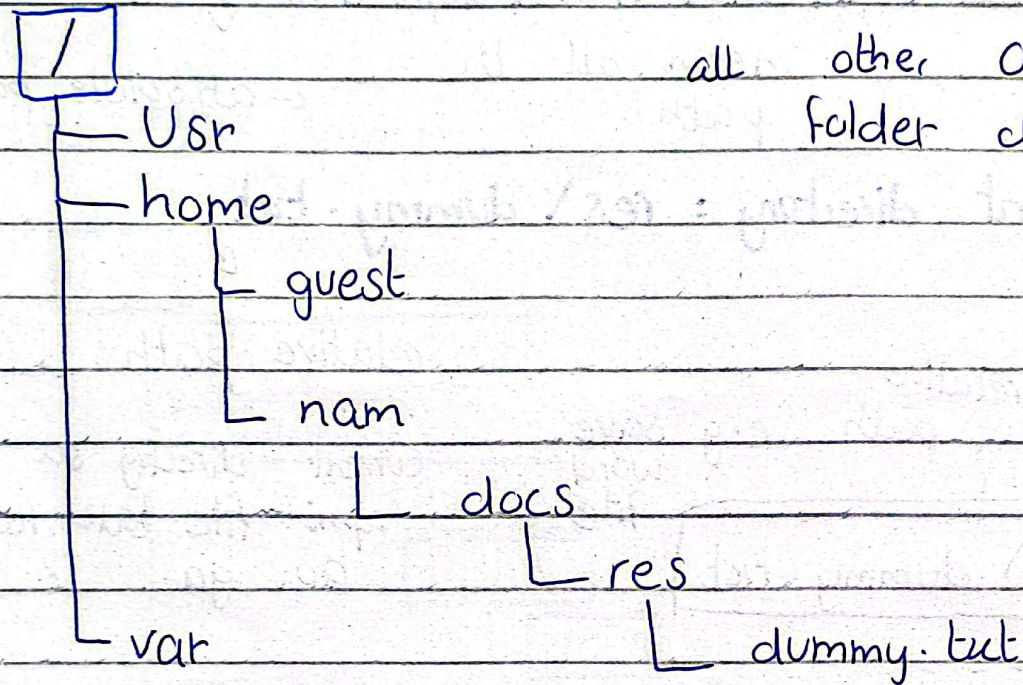

docs \ res \ dummy.txt

relative path
↓

current directory save
apni file late leaisay
ao ga-

docs \ dummy.txt ! -> its relative path

Mac filesys:-

all other OS called the folder directory.

/home/nam/docs/res/dummy.txt
↓
absolute path

variable string
directory = 'res' → filename
name = 'dummy.txt'

import os

filename = os.path.join(directory, name) → it handle it self
print filename the to add
forward / and
back \

output: res/dummy.txt

mode r=read
f = open(filename, 'r') # handle
and in return it give you a handle by
which you further communicate with that file
and that handle is in f variable.

for line in f:

print line

, print line.strip()

it remove

first and last

white space

f.close() # never forget this!

↓ now close the handle

better way use context manager:-

← with open(filename, 'r') as f: (mean t= ")

content
manager

for line in f:

print line.strip()

only

in

with itself close the file for you

python

one other way

print f.read()

→ all file read

whole file

cut
'a-b-c' . split ('-')

['a', 'b', 'c']

print f.read().split('\n')
[' ',
 ' ',
]

insert
کے
\n
کی

Writing to files

```
out_name = "dummy-out.txt"
out_filename = os.path.join(directory, out_name)
print out_filename
with open(out_filename, 'w') as f:
    f.write("One ... ")
```

pehlay wala khatam or new write karo
use 'a' append

ch 1 to 4 all by book.
