

Introduction to computing

Pointers :-

```
#include <iostream>
using namespace std;
void point() { int x = 25;
    cout << "value of x is:" << x << endl;
    cout << "address of x is : " << &x << endl;
```

↓
pointer

→ denote a pointer

```
int *p;
p = &x;
```

```
cout << "value at add of pointed to by p" << *p;
cout << "value of p itself is : " << p << endl;
```

dereferencing → *p

```
void point_array_test() {
```

```
    int nums[10];
```

```
    for (int i=0; i < 10; i++) {
```

```
        a[i] = i + 10
```

```
    }
```

```
    int *p;
```

```
    p = nums;
```

```
    cout << "value of nums : " << nums << endl;
```

```
    cout << "value of &nums[0]" << &nums[0] << endl;
```

```
    cout << "value of p is : " << p << endl;
```

```
    cout << "value of *p is : " << *p << endl;
```

```
    cout << "inc p : " << endl;
```

p++;

```
cout << "value of p: " << p << endl;  
cout << "value at p: " << *p << endl;
```

```
int *p, *q;  
q = NULL; // 0  
p = &x;
```

pass by
reference

break abstraction

(*p.)

→ p →

syntactic sugar
